

CASE STUDY:

YRG Group

OUR CLIENT:

YRG Group has been providing reprographic services for packaging printers and end-user clients since 1974. With a thorough knowledge of the food and drink, confectionery and household and healthcare markets, the company has expanded into a multi-million-pound business with sites in the UK, Ireland and Africa.

THE CHALLENGE:

YRG relies on slick production facilities and technology to produce artwork, reprographics, Flexographic printing plates and sleeves on a large scale for numerous clients. To meet the demands of customers and its future growth projections, the company needed help to build a more efficient, secure and robust IT infrastructure across its six sites.

THE SOLUTION:

We rebuilt the existing virtualized environments for YRG's production and office facilities in York and set up a multi-site disaster recovery solution to ensure data would be readily available to the business in the event of network outages, power interruptions or hardware and software failure.

We also audited the remaining group sites and made recommendations regarding the existing IT infrastructure which were accepted and actioned.

In addition, our dedicated team built an internet security and filtering solution and deployed new wifi network at YRG's new multi-million-pound site in Cottingham, East Yorkshire.

Denis Fitzgerald, operations manager at YRG, said: "With the assistance of our new IT provider Opal, the business is now running very stable and efficiently. Our production times have increased, there's much less downtime and our data storage and disaster recovery capabilities are far more robust."
